The Development of Large-Area Psec-Resolution TOF Systems

Henry Frisch
Enrico Fermi Institute and Physics Dept
University of Chicago

An introduction- many thanks to many folks- my collaborators, and esp. Patrick, Christophe, and Saclay for organizing and hosting this meeting.
OUTLINE

1. Introduction;

2. Three Key Developments since the 60’s: a) MCP’s, 200 GHZ electronics, and End-to-end Simulation;

3. HEP Needs: Particle ID and Flavor Flow, Heavy Particles, Displaced Vertices, Photon Vertex Determination;

4. The Need for End-to-End Simulation in Parallel;

5. Other Areas? Other techniques?

6. What Determines the Ultimate Limits?

7. A Wish List of Answers to Questions.
Introduction

• Resolution on time measurements translates into resolution in space, which in turn impact momentum and energy measurements.

• Silicon Strip Detectors and Pixels have reduced position resolutions to ~10 microns or better.

• Time resolution hasn’t kept pace- not much changed since the 60’s in large-scale TOF system resolutions and technologies (thick scint. or crystals, PM’s, Lecroy TDC’s)

• Improving time measurements is fundamental, and can affect many fields: particle physics, medical imaging, accelerators, astro and nuclear physics, laser ranging, ...

• Need to understand what are the limiting underlying physical processes- e.g. source line widths, photon statistics, e/photon path length variations.
Possible Collider Applications

• Separating b from b-bar in measuring the top mass (lessens combinatorics => much better resolution)

• Identifying cs-bar and ud-bar modes of the W to jj decays in the top mass analysis

• Separating out vertices from different collisions at the LHC in the z-t plane

• Identifying photons with vertices at the LHC (requires spatial resolution and converter ahead of the TOF system)

• Locating the Higgs vertex in H to gamma-gamma at the LHC (mass resolution)

• Kaon ID in same-sign tagging in B physics (X3 in CDF Bs mixing analysis)

• Fixed target geometries- LHCb, Diffractive LHC Higgs, (and rare K and charm fixed-target experiments)

• Super-B factory (Nagoya Group, V’avra at SLAC)

• Strange, Charm, Beauty and Baryon Flow in Heavy Ion
Why has 100 psec been the # for 60 yrs?

Typical path lengths for light and electrons are set by physical dimensions of the light collection and amplifying device.

These are now on the order of an inch. One inch is 100 psec. That’s what we measure—no surprise! (pictures from T. Credo)
Major advances for TOF measurements:

1. Development of MCP’s with 6-10 micron pore diameters

Microphotograph of Burle 25 micron tube-Greg Sellberg (Fermilab)
Major advances for TOF measurements:

2. Ability to simulate electronics and systems to predict design performance

Output at anode from simulation of 10 particles going through fused quartz window - T. Credo, R. Schroll

Jitter on leading edge 0.86 psec
Major advances for TOF measurements:

Simulation with IHP Gen3 SiGe process - Fukun Tang (EFI-EDG)

3. Electronics with typical gate jitters $\ll 1$ psec
Major advances for TOF measurements:

3a. Oscillator with predicted jitter $\sim5$ femtosec (!) (basis for PLL for our 1-psec TDC).

Output at anode from simulation of 10 particles going through fused quartz window - T. Credo, R. Schroll

Jitter on leading edge 0.86 psec
Each module has 5 chips - 4 TDC chips (one per quadrant) and a DAQ `mother' chip.

Problems are stability, calibration, rel. phase, noise.

Both chips are underway.
Simulation of Circuits (Tang)

**Approaches & Possibilities**
From Harold’s talk, we will build two chips for tube readout:
1. psFront-end
2. psTransport

**SIM-IV: Time-to-Amplitude (TAC) Schematics**
Based on IHP 0.25μm BiCMOS Process

**Switch Forward Charge Cancellation**

**SIM-II: Zero-Crossing Voltage Comparator Schematics**
Based on IHP 0.25μm BiCMOS Process

2 gain stages, 2 level shifters, $A = 400$

**SIM-IV: TAC Outputs vs. Tw Inputs**
Sweep Tw from 1ns to 1.01ns with 1ps increment

**TAC Sensitivity** = - 640μV/ps
Readout with sub-psec resolution:

Taken at Fermilab by Hogan –

Design by Fukun Tang
DAQ Chip- 1/module

- Jakob Van Santen implemented the DAQ chip functionality in an Altera FPGA-tool-rich environment allowed simulation of the functionality and VHDL output before chip construction (Senior Thesis project in Physics).
- Will be designed in IBM process (we think) at Argonne by Gary Drake and co.
- Again, simulation means one doesn’t have to do trial-and-error.
Why is simulation essential?

- Want optimized MCP/Photodetector design-complex problem in electrostatics, fast circuits, surface physics, ....
- Want maximum performance without trial-and-error optimization (time, cost, performance)
- At these speeds (~1 psec) cannot probe electronics (for many reasons!)
- Debugging is impossible any other way.
Simulation for Coil Showering and various PMTs

- Right now, we have a simulation using GEANT4, ROOT, connected by a python script
- GEANT4: $\pi^+$ enters solenoid, e- showers
- ROOT: MCP simulation - get position, time of arrival of charge at anode pads
- Both parts are approximations
- Could we make this less home-brew and more modular?
- Could we use GATE (Geant4 Application for Tomographic Emission) to simplify present and future modifications?
- Working with Chin-tu Chen, Chien-Minh Kao and group, - they know GATE very well!
Interface to Other Simulation Tools

Questions on Simulation-Tasks (for discussion)

1. Framework - what is the modern CS approach?
2. Listing the modules - is there an architype set of modules?
3. Do we have any of these modules at present?
4. Can we specify the interfaces between modules - info and formats?
5. Do we have any of these interfaces at present?
6. Does it make sense to do Medical Imaging and HEP in one framework?
7. Are there existing simulations for MCP’s?
Present Status of ANL/UC

1. Have a simulation of Cherenkov radiation in MCP into electronics.

2. Have placed an order with Burle/Photonis- have the 1st of 4 tubes and have a good working relationship (their good will and expertise is a major part of the effort): 10 micron tube in the works; optimized versions discussed;

3. Harold and Tang have a good grasp of the overall system problems and scope, and have a top-level design plus details.

4. Have licences and tools from IHP and IBM working on our work stations. Made VCO in IHP; have design in IBM 8HP process.

5. Have modeled DAQ/System chip in Altera (Jakob Van Santen); ANL will continue in faster format.

6. ANL has built a test stand with working DAQ, very-fast laser, and has made contact with advanced accel folks:(+students)

7. Have established strong working relationship with Chin-Tu Chen’s PET group at UC; Have proposed a program in the application of HEP to med imaging.

8. Have found Greg Sellberg and Hogan at Fermilab to offer expert precision assembly advice and help (wonderful tools and talent!).
The Future of Psec Timing:

Big Questions:

From the work of the Nagoya Group, Jerry Va’vra, and ourselves it looks that the psec goal is not impossible. It’s a new field, and we have made first forays, and understand some fundamentals (e.g. need no bounces and short distances), but it’s entirely possible, even likely, that there are still much better ideas out there.

Questions:

• Are there other techniques? (e.g. all Silicon)?

What do we see as the ultimate timing limit?
Smaller Questions for Which I’d Love to Know the Answers

- What is the time structure of signals from crystals in PET? (amplitude vs time at psec level)
- Could one integrate the electronics into the MCP structure- 3D silicon (Paul Horn)?
- Will the capacitative return work?
- How to calibrate the darn thing (a big system)?
- How to distribute the clock
- Can we join forces with others and go faster?
That’s All...
Input Source code, Macros Files
• Geometry
• Materials
• Particle:
  • Type
  • Energy
  • Initial Positions, Momentum
• Physics processes
• Verbose level

• Need to redo geometry (local approx. \(\rightarrow\) cylinder)
• Need to redo field
• Need to connect two modules (python script in place for older simulation)

\(\pi^+\) Generation, Coil
Showering
GEANT4

Have position, time, momentum, kinetic energy of each particle for each step (including upon entrance to PMT)

PMT/MCP
GEANT4 - swappable

Pure GEANT4
